

$$P_{12}(\mathbf{q}) \propto \left| \mathbf{A}_{12}(\mathbf{q}) \cdot \begin{matrix} \text{PM} \\ \updownarrow \end{matrix} \right|^2$$

The diagram illustrates the relationship between the polarization function $P_{12}(\mathbf{q})$ and the vector field $\mathbf{A}_{12}(\mathbf{q})$. The vector field is represented by a red circle with blue arrows pointing radially outward, indicating a divergent field. The polarization vector PM is shown as a vertical double-headed arrow, indicating its orientation. The entire expression is enclosed in a square with a superscript 2, representing the squared magnitude of the dot product.
