

$$P_{12}(\vec{q}) \propto \left| \vec{A}_{12}(\vec{q}) \right| \cdot \left| \theta_{\text{PM}} \right|^2$$

The diagram illustrates the components of the equation. On the left, a red circle represents a vector field $\vec{A}_{12}(\vec{q})$, with blue arrows pointing radially outward from its center. This circle is enclosed within a vertical line representing the magnitude $|\vec{A}_{12}(\vec{q})|$. To the right of the circle is a black dot representing a scalar product. Further right is an angle θ_{PM} , shown as a curved line between a vertical axis and a horizontal axis, with a double-headed arrow indicating the angle. This angle is enclosed within a vertical line representing the squared magnitude $|\theta_{\text{PM}}|^2$.
